

Errors

Applications running in Node.js will generally experience four categories of errors:

- Standard JavaScript errors such as [<EvalError>](#), [<SyntaxError>](#), [<RangeError>](#), [<ReferenceError>](#), [<TypeError>](#), and [<URIError>](#).
- System errors triggered by underlying operating system constraints such as attempting to open a file that does not exist or attempting to send data over a closed socket.
- User-specified errors triggered by application code.
- `AssertionError`s are a special class of error that can be triggered when Node.js detects an exceptional logic violation that should never occur. These are raised typically by the `node:assert` module.

All JavaScript and system errors raised by Node.js inherit from, or are instances of, the standard JavaScript [<Error>](#) class and are guaranteed to provide *at least* the properties available on that class.

Error propagation and interception

Node.js supports several mechanisms for propagating and handling errors that occur while an application is running. How these errors are reported and handled depends entirely on the type of `Error` and the style of the API that is called.

All JavaScript errors are handled as exceptions that *immediately* generate and throw an error using the standard JavaScript `throw` mechanism. These are handled using the [try...catch construct](#) provided by the JavaScript language.

```
// Throws with a ReferenceError because z is not defined.
try {
  const m = 1;
  const n = m + z;
} catch (err) {
  // Handle the error here.
}
```

COPY

Any use of the JavaScript `throw` mechanism will raise an exception that *must* be handled or the Node.js process will exit immediately.

With few exceptions, *Synchronous* APIs (any blocking method that does not return a [<Promise>](#) nor accept a `callback` function, such as [fs.readFileSync](#)), will use `throw` to report errors.

Errors that occur within *Asynchronous APIs* may be reported in multiple ways:

- Some asynchronous methods returns a [<Promise>](#), you should always take into account that it might be rejected. See [--unhandled-rejections](#) flag for how the process will react to an unhandled promise rejection.

```
const fs = require('fs/promises');

(async () => {
  let data;
  try {
    data = await fs.readFile('a file that does not exist');
  } catch (err) {
    console.error('There was an error reading the file!', err);
  }
})
```

```

    return;
  }
  // Otherwise handle the data
})();

```

COPY

- Most asynchronous methods that accept a `callback` function will accept an `Error` object passed as the first argument to that function. If that first argument is not `null` and is an instance of `Error`, then an error occurred that should be handled.

```

const fs = require('node:fs');
fs.readFile('a file that does not exist', (err, data) => {
  if (err) {
    console.error('There was an error reading the file!', err);
    return;
  }
  // Otherwise handle the data
});

```

COPY

- When an asynchronous method is called on an object that is an [EventEmitter](#), errors can be routed to that object's `'error'` event.

```

const net = require('node:net');
const connection = net.connect('localhost');

// Adding an 'error' event handler to a stream:
connection.on('error', (err) => {
  // If the connection is reset by the server, or if it can't
  // connect at all, or on any sort of error encountered by
  // the connection, the error will be sent here.
  console.error(err);
});

connection.pipe(process.stdout);

```

COPY

- A handful of typically asynchronous methods in the Node.js API may still use the `throw` mechanism to raise exceptions that must be handled using `try...catch`. There is no comprehensive list of such methods; please refer to the documentation of each method to determine the appropriate error handling mechanism required.

The use of the `'error'` event mechanism is most common for [stream-based](#) and [event emitter-based](#) APIs, which themselves represent a series of asynchronous operations over time (as opposed to a single operation that may pass or fail).

For all [EventEmitter](#) objects, if an `'error'` event handler is not provided, the error will be thrown, causing the Node.js process to report an uncaught exception and crash unless either: a handler has been registered for the `'uncaughtException'` event, or the deprecated [node:domain](#) module is used.

```

const EventEmitter = require('node:events');
const ee = new EventEmitter();

setImmediate(() => {
  // This will crash the process because no 'error' event
  // handler has been added.
  ee.emit('error', new Error('This will crash'));
});

```

COPY

Errors generated in this way *cannot* be intercepted using `try...catch` as they are thrown *after* the calling code has already exited.

Developers must refer to the documentation for each method to determine exactly how errors raised by those methods are propagated.

Class: Error

A generic JavaScript [<Error>](#) object that does not denote any specific circumstance of why the error occurred. `Error` objects capture a "stack trace" detailing the point in the code at which the `Error` was instantiated, and may provide a text description of the error.

All errors generated by Node.js, including all system and JavaScript errors, will either be instances of, or inherit from, the `Error` class.

`new Error(message[, options])`

- `message` [<string>](#)
- `options` [<Object>](#)
 - `cause` [<any>](#) The error that caused the newly created error.

Creates a new `Error` object and sets the `error.message` property to the provided text message. If an object is passed as `message`, the text message is generated by calling `String(message)`. If the `cause` option is provided, it is assigned to the `error.cause` property. The `error.stack` property will represent the point in the code at which `new Error()` was called. Stack traces are dependent on [V8's stack trace API](#). Stack traces extend only to either (a) the beginning of *synchronous code execution*, or (b) the number of frames given by the property `Error.stackTraceLimit`, whichever is smaller.

`Error.captureStackTrace(targetObject[, constructorOpt])`

- `targetObject` [<Object>](#)
- `constructorOpt` [<Function>](#)

Creates a `.stack` property on `targetObject`, which when accessed returns a string representing the location in the code at which `Error.captureStackTrace()` was called.

```
const myObject = {};  
Error.captureStackTrace(myObject);  
myObject.stack; // Similar to `new Error().stack`
```

COPY

The first line of the trace will be prefixed with `${myObject.name}: ${myObject.message}`.

The optional `constructorOpt` argument accepts a function. If given, all frames above `constructorOpt`, including `constructorOpt`, will be omitted from the generated stack trace.

The `constructorOpt` argument is useful for hiding implementation details of error generation from the user. For instance:

```
function a() {  
  b();  
}  
  
function b() {  
  c();  
}  
  
function c() {  
  // Create an error without stack trace to avoid calculating the stack trace twice.  
  const { stackTraceLimit } = Error;  
  Error.stackTraceLimit = 0;
```

```

const error = new Error();
Error.stackTraceLimit = stackTraceLimit;

// Capture the stack trace above function b
Error.captureStackTrace(error, b); // Neither function c, nor b is included in the stack trace
throw error;
}

a();

```

COPY

Error.stackTraceLimit

- [<number>](#)

The `Error.stackTraceLimit` property specifies the number of stack frames collected by a stack trace (whether generated by `new Error().stack` or `Error.captureStackTrace(obj)`).

The default value is `10` but may be set to any valid JavaScript number. Changes will affect any stack trace captured *after* the value has been changed.

If set to a non-number value, or set to a negative number, stack traces will not capture any frames.

error.cause

- [<any>](#)

If present, the `error.cause` property is the underlying cause of the `Error`. It is used when catching an error and throwing a new one with a different message or code in order to still have access to the original error.

The `error.cause` property is typically set by calling `new Error(message, { cause })`. It is not set by the constructor if the `cause` option is not provided.

This property allows errors to be chained. When serializing `Error` objects, [`util.inspect\(\)`](#) recursively serializes `error.cause` if it is set.

```

const cause = new Error('The remote HTTP server responded with a 500 status');
const symptom = new Error('The message failed to send', { cause });

console.log(symptom);
// Prints:
//   Error: The message failed to send
//     at REPL2:1:17
//     at Script.runInThisContext (node:vm:130:12)
//     ... 7 lines matching cause stack trace ...
//     at [_line] [as _line] (node:internal/readline/interface:886:18) {
//   [cause]: Error: The remote HTTP server responded with a 500 status
//     at REPL1:1:15
//     at Script.runInThisContext (node:vm:130:12)
//     at REPLServer.defaultEval (node:repl:574:29)
//     at bound (node:domain:426:15)
//     at REPLServer.runBound [as eval] (node:domain:437:12)
//     at REPLServer.onLine (node:repl:902:10)
//     at REPLServer.emit (node:events:549:35)
//     at REPLServer.emit (node:domain:482:12)
//     at [_onLine] [as _onLine] (node:internal/readline/interface:425:12)
//     at [_line] [as _line] (node:internal/readline/interface:886:18)

```

COPY

error.code

- `<string>`

The `error.code` property is a string label that identifies the kind of error. `error.code` is the most stable way to identify an error. It will only change between major versions of Node.js. In contrast, `error.message` strings may change between any versions of Node.js. See [Node.js error codes](#) for details about specific codes.

error.message

- `<string>`

The `error.message` property is the string description of the error as set by calling `new Error(message)`. The `message` passed to the constructor will also appear in the first line of the stack trace of the `Error`, however changing this property after the `Error` object is created *may not* change the first line of the stack trace (for example, when `error.stack` is read before this property is changed).

```
const err = new Error('The message');
console.error(err.message);
// Prints: The message
```

COPY

error.stack

- `<string>`

The `error.stack` property is a string describing the point in the code at which the `Error` was instantiated.

```
Error: Things keep happening!
    at /home/gbusey/file.js:525:2
    at Frobnicator.refrobulate (/home/gbusey/business-logic.js:424:21)
    at Actor.<anonymous> (/home/gbusey/actors.js:400:8)
    at increaseSynergy (/home/gbusey/actors.js:701:6)
```

COPY

The first line is formatted as `<error class name>: <error message>`, and is followed by a series of stack frames (each line beginning with "at "). Each frame describes a call site within the code that lead to the error being generated. V8 attempts to display a name for each function (by variable name, function name, or object method name), but occasionally it will not be able to find a suitable name. If V8 cannot determine a name for the function, only location information will be displayed for that frame. Otherwise, the determined function name will be displayed with location information appended in parentheses.

Frames are only generated for JavaScript functions. If, for example, execution synchronously passes through a C++ addon function called `cheetahify` which itself calls a JavaScript function, the frame representing the `cheetahify` call will not be present in the stack traces:

```
const cheetahify = require('./native-binding.node');

function makeFaster() {
  // `cheetahify()` *synchronously* calls speedy.
  cheetahify(function speedy() {
    throw new Error('oh no!');
  });
}

makeFaster();
// will throw:
//   /home/gbusey/file.js:6
//     throw new Error('oh no!');
```

```
//      ^
//   Error: oh no!
//       at speedy (/home/gbusey/file.js:6:11)
//       at makeFaster (/home/gbusey/file.js:5:3)
//       at Object.<anonymous> (/home/gbusey/file.js:10:1)
//       at Module._compile (module.js:456:26)
//       at Object.Module._extensions..js (module.js:474:10)
//       at Module.load (module.js:356:32)
//       at Function.Module._load (module.js:312:12)
//       at Function.Module.runMain (module.js:497:10)
//       at startup (node.js:119:16)
//       at node.js:906:3
```

COPY

The location information will be one of:

- `native`, if the frame represents a call internal to V8 (as in `[]`.forEach).
- `plain-filename.js:line:column`, if the frame represents a call internal to Node.js.
- `/absolute/path/to/file.js:line:column`, if the frame represents a call in a user program (using CommonJS module system), or its dependencies.
- `<transport-protocol>://url/to/module/file.mjs:line:column`, if the frame represents a call in a user program (using ES module system), or its dependencies.

The string representing the stack trace is lazily generated when the `error.stack` property is **accessed**.

The number of frames captured by the stack trace is bounded by the smaller of `Error.stackTraceLimit` or the number of available frames on the current event loop tick.

Class: AssertionError

- Extends: [<errors.Error>](#)

Indicates the failure of an assertion. For details, see [Class: assert.AssertionError](#).

Class: RangeError

- Extends: [<errors.Error>](#)

Indicates that a provided argument was not within the set or range of acceptable values for a function; whether that is a numeric range, or outside the set of options for a given function parameter.

```
require('node:net').connect(-1);
// Throws "RangeError: "port" option should be >= 0 and < 65536: -1"
```

COPY

Node.js will generate and throw `RangeError` instances *immediately* as a form of argument validation.

Class: ReferenceError

- Extends: [<errors.Error>](#)

Indicates that an attempt is being made to access a variable that is not defined. Such errors commonly indicate typos in code, or an otherwise broken program.

While client code may generate and propagate these errors, in practice, only V8 will do so.

```
doesNotExist;  
// Throws ReferenceError, doesNotExist is not a variable in this program.
```

COPY

Unless an application is dynamically generating and running code, `ReferenceError` instances indicate a bug in the code or its dependencies.

Class: SyntaxError

- Extends: [<errors.Error>](#)

Indicates that a program is not valid JavaScript. These errors may only be generated and propagated as a result of code evaluation. Code evaluation may happen as a result of `eval`, `Function`, `require`, or [vm](#). These errors are almost always indicative of a broken program.

```
try {  
  require('node:vm').runInThisContext('binary ! isNotOk');  
} catch (err) {  
  // 'err' will be a SyntaxError.  
}
```

COPY

`SyntaxError` instances are unrecoverable in the context that created them – they may only be caught by other contexts.

Class: SystemError

- Extends: [<errors.Error>](#)

Node.js generates system errors when exceptions occur within its runtime environment. These usually occur when an application violates an operating system constraint. For example, a system error will occur if an application attempts to read a file that does not exist.

- `address` [<string>](#) If present, the address to which a network connection failed
- `code` [<string>](#) The string error code
- `dest` [<string>](#) If present, the file path destination when reporting a file system error
- `errno` [<number>](#) The system-provided error number
- `info` [<Object>](#) If present, extra details about the error condition
- `message` [<string>](#) A system-provided human-readable description of the error
- `path` [<string>](#) If present, the file path when reporting a file system error
- `port` [<number>](#) If present, the network connection port that is not available
- `syscall` [<string>](#) The name of the system call that triggered the error

error.address

- [<string>](#)

If present, `error.address` is a string describing the address to which a network connection failed.

error.code

- [<string>](#)

The `error.code` property is a string representing the error code.

error.dest

- [<string>](#)

If present, `error.dest` is the file path destination when reporting a file system error.

error.errno

- [`<number>`](#)

The `error.errno` property is a negative number which corresponds to the error code defined in [libuv Error handling](#).

On Windows the error number provided by the system will be normalized by libuv.

To get the string representation of the error code, use [`util.getSystemErrorMessage\(error.errno\)`](#).

error.info

- [`<Object>`](#)

If present, `error.info` is an object with details about the error condition.

error.message

- [`<string>`](#)

`error.message` is a system-provided human-readable description of the error.

error.path

- [`<string>`](#)

If present, `error.path` is a string containing a relevant invalid pathname.

error.port

- [`<number>`](#)

If present, `error.port` is the network connection port that is not available.

error.syscall

- [`<string>`](#)

The `error.syscall` property is a string describing the [`syscall`](#) that failed.

Common system errors

This is a list of system errors commonly-encountered when writing a Node.js program. For a comprehensive list, see the [errno\(3\) man page](#).

- **EACCES** (Permission denied): An attempt was made to access a file in a way forbidden by its file access permissions.
- **EADDRINUSE** (Address already in use): An attempt to bind a server ([net](#) , [http](#) , or [https](#)) to a local address failed due to another server on the local system already occupying that address.
- **ECONNREFUSED** (Connection refused): No connection could be made because the target machine actively refused it. This usually results from trying to connect to a service that is inactive on the foreign host.
- **ECONNRESET** (Connection reset by peer): A connection was forcibly closed by a peer. This normally results from a loss of the connection on the remote socket due to a timeout or reboot. Commonly encountered via the [http](#) and [net](#) modules.
- **EEXIST** (File exists): An existing file was the target of an operation that required that the target not exist.
- **EISDIR** (Is a directory): An operation expected a file, but the given pathname was a directory.
- **EMFILE** (Too many open files in system): Maximum number of [file descriptors](#) allowable on the system has been reached, and requests for another descriptor cannot be fulfilled until at least one has been closed. This is encountered when opening many files at once in

parallel, especially on systems (in particular, macOS) where there is a low file descriptor limit for processes. To remedy a low limit, run `ulimit -n 2048` in the same shell that will run the Node.js process.

- **ENOENT** (No such file or directory): Commonly raised by `fs` operations to indicate that a component of the specified pathname does not exist. No entity (file or directory) could be found by the given path.
- **ENOTDIR** (Not a directory): A component of the given pathname existed, but was not a directory as expected. Commonly raised by `fs.readdir`.
- **ENOTEMPTY** (Directory not empty): A directory with entries was the target of an operation that requires an empty directory, usually `fs.unlink`.
- **ENOTFOUND** (DNS lookup failed): Indicates a DNS failure of either `EAI_NODATA` or `EAI_NONAME`. This is not a standard POSIX error.
- **EPERM** (Operation not permitted): An attempt was made to perform an operation that requires elevated privileges.
- **EPIPE** (Broken pipe): A write on a pipe, socket, or FIFO for which there is no process to read the data. Commonly encountered at the `net` and `http` layers, indicative that the remote side of the stream being written to has been closed.
- **ETIMEDOUT** (Operation timed out): A connect or send request failed because the connected party did not properly respond after a period of time. Usually encountered by `http` or `net`. Often a sign that a `socket.end()` was not properly called.

Class: `TypeError`

- Extends `<errors.Error>`

Indicates that a provided argument is not an allowable type. For example, passing a function to a parameter which expects a string would be a `TypeError`.

```
require('node:url').parse(() => { });  
// Throws TypeError, since it expected a string.
```

COPY

Node.js will generate and throw `TypeError` instances *immediately* as a form of argument validation.

Exceptions vs. errors

A JavaScript exception is a value that is thrown as a result of an invalid operation or as the target of a `throw` statement. While it is not required that these values are instances of `Error` or classes which inherit from `Error`, all exceptions thrown by Node.js or the JavaScript runtime *will* be instances of `Error`.

Some exceptions are *unrecoverable* at the JavaScript layer. Such exceptions will *always* cause the Node.js process to crash. Examples include `assert()` checks or `abort()` calls in the C++ layer.

OpenSSL errors

Errors originating in `crypto` or `tls` are of class `Error`, and in addition to the standard `.code` and `.message` properties, may have some additional OpenSSL-specific properties.

`error.opensslErrorStack`

An array of errors that can give context to where in the OpenSSL library an error originates from.

`error.function`

The OpenSSL function the error originates in.

error.library

The OpenSSL library the error originates in.

error.reason

A human-readable string describing the reason for the error.

Node.js error codes

ABORT_ERR

Used when an operation has been aborted (typically using an `AbortController`).

APIs *not* using `AbortSignal` s typically do not raise an error with this code.

This code does not use the regular `ERR_*` convention Node.js errors use in order to be compatible with the web platform's `AbortError` .

ERR_ACCESS_DENIED

A special type of error that is triggered whenever Node.js tries to get access to a resource restricted by the [Permission Model](#) .

ERR_AMBIGUOUS_ARGUMENT

A function argument is being used in a way that suggests that the function signature may be misunderstood. This is thrown by the `node:assert` module when the `message` parameter in `assert.throws(block, message)` matches the error message thrown by `block` because that usage suggests that the user believes `message` is the expected message rather than the message the `AssertionError` will display if `block` does not throw.

ERR_ARG_NOT_ITERABLE

An iterable argument (i.e. a value that works with `for...of` loops) was required, but not provided to a Node.js API.

ERR_ASSERTION

A special type of error that can be triggered whenever Node.js detects an exceptional logic violation that should never occur. These are raised typically by the `node:assert` module.

ERR_ASYNC_CALLBACK

An attempt was made to register something that is not a function as an `AsyncHooks` callback.

ERR_ASYNC_TYPE

The type of an asynchronous resource was invalid. Users are also able to define their own types if using the public embedder API.

ERR_BROTLI_COMPRESSION_FAILED

Data passed to a Brotli stream was not successfully compressed.

ERR_BROTLI_INVALID_PARAM

An invalid parameter key was passed during construction of a Brotli stream.

ERR_BUFFER_CONTEXT_NOT_AVAILABLE

An attempt was made to create a `Node.js Buffer` instance from addon or embedder code, while in a JS engine Context that is not associated with a `Node.js` instance. The data passed to the `Buffer` method will have been released by the time the method returns.

When encountering this error, a possible alternative to creating a `Buffer` instance is to create a normal `Uint8Array`, which only differs in the prototype of the resulting object. `Uint8Array`s are generally accepted in all `Node.js` core APIs where `Buffer`s are; they are available in all Contexts.

ERR_BUFFER_OUT_OF_BOUNDS

An operation outside the bounds of a `Buffer` was attempted.

ERR_BUFFER_TOO_LARGE

An attempt has been made to create a `Buffer` larger than the maximum allowed size.

ERR_CANNOT_WATCH_SIGINT

`Node.js` was unable to watch for the `SIGINT` signal.

ERR_CHILD_CLOSED_BEFORE_REPLY

A child process was closed before the parent received a reply.

ERR_CHILD_PROCESS_IPC_REQUIRED

Used when a child process is being forked without specifying an IPC channel.

ERR_CHILD_PROCESS_STDIO_MAXBUFFER

Used when the main process is trying to read data from the child process's `STDERR/STDOUT`, and the data's length is longer than the `maxBuffer` option.

ERR_CLOSED_MESSAGE_PORT

There was an attempt to use a `MessagePort` instance in a closed state, usually after `.close()` has been called.

ERR_CONSOLE_WRITABLE_STREAM

`Console` was instantiated without `stdout` stream, or `Console` has a non-writable `stdout` or `stderr` stream.

ERR_CONSTRUCT_CALL_INVALID

A class constructor was called that is not callable.

ERR_CONSTRUCT_CALL_REQUIRED

A constructor for a class was called without `new`.

ERR_CONTEXT_NOT_INITIALIZED

The vm context passed into the API is not yet initialized. This could happen when an error occurs (and is caught) during the creation of the context, for example, when the allocation fails or the maximum call stack size is reached when the context is created.

ERR_CRYPTO_CUSTOM_ENGINE_NOT_SUPPORTED

An OpenSSL engine was requested (for example, through the `clientCertEngine` or `privateKeyEngine` TLS options) that is not supported by the version of OpenSSL being used, likely due to the compile-time flag `OPENSSL_NO_ENGINE`.

ERR_CRYPT0_ECDH_INVALID_FORMAT

An invalid value for the `format` argument was passed to the `crypto.ECDH()` class `getPublicKey()` method.

ERR_CRYPT0_ECDH_INVALID_PUBLIC_KEY

An invalid value for the `key` argument has been passed to the `crypto.ECDH()` class `computeSecret()` method. It means that the public key lies outside of the elliptic curve.

ERR_CRYPT0_ENGINE_UNKNOWN

An invalid crypto engine identifier was passed to `require('node:crypto').setEngine()`.

ERR_CRYPT0_FIPS_FORCED

The `--force-fips` command-line argument was used but there was an attempt to enable or disable FIPS mode in the `node:crypto` module.

ERR_CRYPT0_FIPS_UNAVAILABLE

An attempt was made to enable or disable FIPS mode, but FIPS mode was not available.

ERR_CRYPT0_HASH_FINALIZED

`hash.digest()` was called multiple times. The `hash.digest()` method must be called no more than one time per instance of a `Hash` object.

ERR_CRYPT0_HASH_UPDATE_FAILED

`hash.update()` failed for any reason. This should rarely, if ever, happen.

ERR_CRYPT0_INCOMPATIBLE_KEY

The given crypto keys are incompatible with the attempted operation.

ERR_CRYPT0_INCOMPATIBLE_KEY_OPTIONS

The selected public or private key encoding is incompatible with other options.

ERR_CRYPT0_INITIALIZATION_FAILED

Initialization of the crypto subsystem failed.

ERR_CRYPT0_INVALID_AUTH_TAG

An invalid authentication tag was provided.

ERR_CRYPT0_INVALID_COUNTER

An invalid counter was provided for a counter-mode cipher.

ERR_CRYPT0_INVALID_CURVE

An invalid elliptic-curve was provided.

ERR_CRYPT0_INVALID_DIGEST

An invalid `crypto digest algorithm` was specified.

ERR_CRYPT0_INVALID_IV

An invalid initialization vector was provided.

ERR_CRYPTO_INVALID_JWK

An invalid JSON Web Key was provided.

ERR_CRYPTO_INVALID_KEY_OBJECT_TYPE

The given crypto key object's type is invalid for the attempted operation.

ERR_CRYPTO_INVALID_KEYLEN

An invalid key length was provided.

ERR_CRYPTO_INVALID_KEYPAIR

An invalid key pair was provided.

ERR_CRYPTO_INVALID_KEYTYPE

An invalid key type was provided.

ERR_CRYPTO_INVALID_MESSAGELEN

An invalid message length was provided.

ERR_CRYPTO_INVALID_SCRIPT_PARAMS

Invalid script algorithm parameters were provided.

ERR_CRYPTO_INVALID_STATE

A crypto method was used on an object that was in an invalid state. For instance, calling `cipher.getAuthTag()` before calling `cipher.final()`.

ERR_CRYPTO_INVALID_TAG_LENGTH

An invalid authentication tag length was provided.

ERR_CRYPTO_JOB_INIT_FAILED

Initialization of an asynchronous crypto operation failed.

ERR_CRYPTO_JWK_UNSUPPORTED_CURVE

Key's Elliptic Curve is not registered for use in the [JSON Web Key Elliptic Curve Registry](#).

ERR_CRYPTO_JWK_UNSUPPORTED_KEY_TYPE

Key's Asymmetric Key Type is not registered for use in the [JSON Web Key Types Registry](#).

ERR_CRYPTO_OPERATION_FAILED

A crypto operation failed for an otherwise unspecified reason.

ERR_CRYPTO_PBKDF2_ERROR

The PBKDF2 algorithm failed for unspecified reasons. OpenSSL does not provide more details and therefore neither does Node.js.

ERR_CRYPTO_SCRIPT_INVALID_PARAMETER

One or more [crypto.script\(\)](#) or [crypto.scriptSync\(\)](#) parameters are outside their legal range.

ERR_CRYPTO_SCRIPT_NOT_SUPPORTED

Node.js was compiled without `script` support. Not possible with the official release binaries but can happen with custom builds, including distro builds.

ERR_CRYPTO_SIGN_KEY_REQUIRED

A signing `key` was not provided to the [sign.sign\(\)](#) method.

ERR_CRYPTO_TIMING_SAFE_EQUAL_LENGTH

[crypto.timingSafeEqual\(\)](#) was called with `Buffer`, `TypedArray`, or `DataView` arguments of different lengths.

ERR_CRYPTO_UNKNOWN_CIPHER

An unknown cipher was specified.

ERR_CRYPTO_UNKNOWN_DH_GROUP

An unknown Diffie-Hellman group name was given. See [crypto.getDiffieHellman\(\)](#) for a list of valid group names.

ERR_CRYPTO_UNSUPPORTED_OPERATION

An attempt to invoke an unsupported crypto operation was made.

ERR_DEBUGGER_ERROR

An error occurred with the [debugger](#).

ERR_DEBUGGER_STARTUP_ERROR

The [debugger](#) timed out waiting for the required host/port to be free.

ERR_DLOPEN_DISABLED

Loading native addons has been disabled using [--no-addons](#).

ERR_DLOPEN_FAILED

A call to `process.dlopen()` failed.

ERR_DIR_CLOSED

The [fs.Dir](#) was previously closed.

ERR_DIR_CONCURRENT_OPERATION

A synchronous read or close call was attempted on an [fs.Dir](#) which has ongoing asynchronous operations.

ERR_DNS_SET_SERVERS_FAILED

`c-ares` failed to set the DNS server.

ERR_DOMAIN_CALLBACK_NOT_AVAILABLE

The `node:domain` module was not usable since it could not establish the required error handling hooks, because [`process.setUncaughtExceptionCaptureCallback\(\)`](#) had been called at an earlier point in time.

ERR_DOMAIN_CANNOT_SET_UNCAUGHT_EXCEPTION_CAPTURE

[`process.setUncaughtExceptionCaptureCallback\(\)`](#) could not be called because the `node:domain` module has been loaded at an earlier point in time.

The stack trace is extended to include the point in time at which the `node:domain` module had been loaded.

ERR_DUPLICATE_STARTUP_SNAPSHOT_MAIN_FUNCTION

[`v8.startupSnapshot.setDeserializeMainFunction\(\)`](#) could not be called because it had already been called before.

ERR_ENCODING_INVALID_ENCODED_DATA

Data provided to `TextDecoder()` API was invalid according to the encoding provided.

ERR_ENCODING_NOT_SUPPORTED

Encoding provided to `TextDecoder()` API was not one of the [WHATWG Supported Encodings](#).

ERR_EVAL_ESM_CANNOT_PRINT

`--print` cannot be used with ESM input.

ERR_EVENT_RECURSION

Thrown when an attempt is made to recursively dispatch an event on `EventTarget`.

ERR_EXECUTION_ENVIRONMENT_NOT_AVAILABLE

The JS execution context is not associated with a Node.js environment. This may occur when Node.js is used as an embedded library and some hooks for the JS engine are not set up properly.

ERR_FALSY_VALUE_REJECTION

A `Promise` that was callbackified via `util.callbackify()` was rejected with a falsy value.

ERR_FEATURE_UNAVAILABLE_ON_PLATFORM

Used when a feature that is not available to the current platform which is running Node.js is used.

ERR_FS_CP_DIR_TO_NON_DIR

An attempt was made to copy a directory to a non-directory (file, symlink, etc.) using [`fs.cp\(\)`](#).

ERR_FS_CP_EEXIST

An attempt was made to copy over a file that already existed with [`fs.cp\(\)`](#), with the `force` and `errorOnExist` set to `true`.

ERR_FS_CP_EINVAL

When using [`fs.cp\(\)`](#), `src` or `dest` pointed to an invalid path.

ERR_HTTP_BODY_NOT_ALLOWED

An error is thrown when writing to an HTTP response which does not allow contents.

ERR_HTTP_CONTENT_LENGTH_MISMATCH

Response body size doesn't match with the specified content-length header value.

ERR_FS_CP_FIFO_PIPE

An attempt was made to copy a named pipe with `fs.cp()`.

ERR_FS_CP_NON_DIR_TO_DIR

An attempt was made to copy a non-directory (file, symlink, etc.) to a directory using `fs.cp()`.

ERR_FS_CP_SOCKET

An attempt was made to copy to a socket with `fs.cp()`.

ERR_FS_CP_SYMLINK_TO_SUBDIRECTORY

When using `fs.cp()`, a symlink in `dest` pointed to a subdirectory of `src`.

ERR_FS_CP_UNKNOWN

An attempt was made to copy to an unknown file type with `fs.cp()`.

ERR_FS_EISDIR

Path is a directory.

ERR_FS_FILE_TOO_LARGE

An attempt has been made to read a file whose size is larger than the maximum allowed size for a `Buffer`.

ERR_FS_INVALID_SYMLINK_TYPE

An invalid symlink type was passed to the `fs.symlink()` or `fs.symlinkSync()` methods.

ERR_HTTP_HEADERS_SENT

An attempt was made to add more headers after the headers had already been sent.

ERR_HTTP_INVALID_HEADER_VALUE

An invalid HTTP header value was specified.

ERR_HTTP_INVALID_STATUS_CODE

Status code was outside the regular status code range (100-999).

ERR_HTTP_REQUEST_TIMEOUT

The client has not sent the entire request within the allowed time.

ERR_HTTP_SOCKET_ASSIGNED

The given [ServerResponse](#) was already assigned a socket.

ERR_HTTP_SOCKET_ENCODING

Changing the socket encoding is not allowed per [RFC 7230 Section 3](#).

ERR_HTTP_TRAILER_INVALID

The `Trailer` header was set even though the transfer encoding does not support that.

ERR_HTTP2_ALTSVC_INVALID_ORIGIN

HTTP/2 ALTSVC frames require a valid origin.

ERR_HTTP2_ALTSVC_LENGTH

HTTP/2 ALTSVC frames are limited to a maximum of 16,382 payload bytes.

ERR_HTTP2_CONNECT_AUTHORITY

For HTTP/2 requests using the `CONNECT` method, the `:authority` pseudo-header is required.

ERR_HTTP2_CONNECT_PATH

For HTTP/2 requests using the `CONNECT` method, the `:path` pseudo-header is forbidden.

ERR_HTTP2_CONNECT_SCHEME

For HTTP/2 requests using the `CONNECT` method, the `:scheme` pseudo-header is forbidden.

ERR_HTTP2_ERROR

A non-specific HTTP/2 error has occurred.

ERR_HTTP2_GOAWAY_SESSION

New HTTP/2 Streams may not be opened after the `Http2Session` has received a `GOAWAY` frame from the connected peer.

ERR_HTTP2_HEADER_SINGLE_VALUE

Multiple values were provided for an HTTP/2 header field that was required to have only a single value.

ERR_HTTP2_HEADERS_AFTER_RESPOND

An additional headers was specified after an HTTP/2 response was initiated.

ERR_HTTP2_HEADERS_SENT

An attempt was made to send multiple response headers.

ERR_HTTP2_INFO_STATUS_NOT_ALLOWED

Informational HTTP status codes (`1xx`) may not be set as the response status code on HTTP/2 responses.

ERR_HTTP2_INVALID_CONNECTION_HEADERS

HTTP/1 connection specific headers are forbidden to be used in HTTP/2 requests and responses.

ERR_HTTP2_INVALID_HEADER_VALUE

An invalid HTTP/2 header value was specified.

ERR_HTTP2_INVALID_INFO_STATUS

An invalid HTTP informational status code has been specified. Informational status codes must be an integer between **100** and **199** (inclusive).

ERR_HTTP2_INVALID_ORIGIN

HTTP/2 **ORIGIN** frames require a valid origin.

ERR_HTTP2_INVALID_PACKED_SETTINGS_LENGTH

Input `Buffer` and `Uint8Array` instances passed to the `http2.getUnpackedSettings()` API must have a length that is a multiple of six.

ERR_HTTP2_INVALID_PSEUDOHEADER

Only valid HTTP/2 pseudoheaders (`:status` , `:path` , `:authority` , `:scheme` , and `:method`) may be used.

ERR_HTTP2_INVALID_SESSION

An action was performed on an `Http2Session` object that had already been destroyed.

ERR_HTTP2_INVALID_SETTING_VALUE

An invalid value has been specified for an HTTP/2 setting.

ERR_HTTP2_INVALID_STREAM

An operation was performed on a stream that had already been destroyed.

ERR_HTTP2_MAX_PENDING_SETTINGS_ACK

Whenever an HTTP/2 **SETTINGS** frame is sent to a connected peer, the peer is required to send an acknowledgment that it has received and applied the new **SETTINGS** . By default, a maximum number of unacknowledged **SETTINGS** frames may be sent at any given time. This error code is used when that limit has been reached.

ERR_HTTP2_NESTED_PUSH

An attempt was made to initiate a new push stream from within a push stream. Nested push streams are not permitted.

ERR_HTTP2_NO_MEM

Out of memory when using the `http2session.setLocalWindowSize(windowSize)` API.

ERR_HTTP2_NO_SOCKET_MANIPULATION

An attempt was made to directly manipulate (read, write, pause, resume, etc.) a socket attached to an `Http2Session` .

ERR_HTTP2_ORIGIN_LENGTH

HTTP/2 **ORIGIN** frames are limited to a length of 16382 bytes.

ERR_HTTP2_OUT_OF_STREAMS

The number of streams created on a single HTTP/2 session reached the maximum limit.

ERR_HTTP2_PAYLOAD_FORBIDDEN

A message payload was specified for an HTTP response code for which a payload is forbidden.

ERR_HTTP2_PING_CANCEL

An HTTP/2 ping was canceled.

ERR_HTTP2_PING_LENGTH

HTTP/2 ping payloads must be exactly 8 bytes in length.

ERR_HTTP2_PSEUDOHEADER_NOT_ALLOWED

An HTTP/2 pseudo-header has been used inappropriately. Pseudo-headers are header key names that begin with the `:` prefix.

ERR_HTTP2_PUSH_DISABLED

An attempt was made to create a push stream, which had been disabled by the client.

ERR_HTTP2_SEND_FILE

An attempt was made to use the `Http2Stream.prototype.responseWithFile()` API to send a directory.

ERR_HTTP2_SEND_FILE_NOSEEK

An attempt was made to use the `Http2Stream.prototype.responseWithFile()` API to send something other than a regular file, but `offset` or `length` options were provided.

ERR_HTTP2_SESSION_ERROR

The `Http2Session` closed with a non-zero error code.

ERR_HTTP2_SETTINGS_CANCEL

The `Http2Session` settings canceled.

ERR_HTTP2_SOCKET_BOUND

An attempt was made to connect a `Http2Session` object to a `net.Socket` or `tls.TLSSocket` that had already been bound to another `Http2Session` object.

ERR_HTTP2_SOCKET_UNBOUND

An attempt was made to use the `socket` property of an `Http2Session` that has already been closed.

ERR_HTTP2_STATUS_101

Use of the `101` Informational status code is forbidden in HTTP/2.

ERR_HTTP2_STATUS_INVALID

An invalid HTTP status code has been specified. Status codes must be an integer between `100` and `599` (inclusive).

ERR_HTTP2_STREAM_CANCEL

An `Http2Stream` was destroyed before any data was transmitted to the connected peer.

ERR_HTTP2_STREAM_ERROR

A non-zero error code was been specified in an `RST_STREAM` frame.

ERR_HTTP2_STREAM_SELF_DEPENDENCY

When setting the priority for an HTTP/2 stream, the stream may be marked as a dependency for a parent stream. This error code is used when an attempt is made to mark a stream and dependent of itself.

ERR_HTTP2_TOO_MANY_CUSTOM_SETTINGS

The number of supported custom settings (10) has been exceeded.

ERR_HTTP2_TOO_MANY_INVALID_FRAMES

The limit of acceptable invalid HTTP/2 protocol frames sent by the peer, as specified through the `maxSessionInvalidFrames` option, has been exceeded.

ERR_HTTP2_TRAILERS_ALREADY_SENT

Trailing headers have already been sent on the `Http2Stream`.

ERR_HTTP2_TRAILERS_NOT_READY

The `http2stream.sendTrailers()` method cannot be called until after the `'wantTrailers'` event is emitted on an `Http2Stream` object. The `'wantTrailers'` event will only be emitted if the `waitForTrailers` option is set for the `Http2Stream`.

ERR_HTTP2_UNSUPPORTED_PROTOCOL

`http2.connect()` was passed a URL that uses any protocol other than `http:` or `https:`.

ERR_ILLEGAL_CONSTRUCTOR

An attempt was made to construct an object using a non-public constructor.

ERR_IMPORT_ASSERTION_TYPE_FAILED

An import `type` attribute was provided, but the specified module is of a different type.

ERR_IMPORT_ASSERTION_TYPE_MISSING

An import attribute is missing, preventing the specified module to be imported.

ERR_IMPORT_ASSERTION_TYPE_UNSUPPORTED

An import attribute is not supported by this version of Node.js.

ERR_IMPORT_ATTRIBUTE_UNSUPPORTED

An import attribute is not supported by this version of Node.js.

ERR_INCOMPATIBLE_OPTION_PAIR

An option pair is incompatible with each other and cannot be used at the same time.

ERR_INPUT_TYPE_NOT_ALLOWED

The `--input-type` flag was used to attempt to execute a file. This flag can only be used with input via `--eval`, `--print`, or `STDIN`.

ERR_INSPECTOR_ALREADY_ACTIVATED

While using the `node:inspector` module, an attempt was made to activate the inspector when it already started to listen on a port. Use `inspector.close()` before activating it on a different address.

ERR_INSPECTOR_ALREADY_CONNECTED

While using the `node:inspector` module, an attempt was made to connect when the inspector was already connected.

ERR_INSPECTOR_CLOSED

While using the `node:inspector` module, an attempt was made to use the inspector after the session had already closed.

ERR_INSPECTOR_COMMAND

An error occurred while issuing a command via the `node:inspector` module.

ERR_INSPECTOR_NOT_ACTIVE

The `inspector` is not active when `inspector.waitForDebugger()` is called.

ERR_INSPECTOR_NOT_AVAILABLE

The `node:inspector` module is not available for use.

ERR_INSPECTOR_NOT_CONNECTED

While using the `node:inspector` module, an attempt was made to use the inspector before it was connected.

ERR_INSPECTOR_NOT_WORKER

An API was called on the main thread that can only be used from the worker thread.

ERR_INTERNAL_ASSERTION

There was a bug in Node.js or incorrect usage of Node.js internals. To fix the error, open an issue at <https://github.com/nodejs/node/issues>.

ERR_INVALID_ADDRESS

The provided address is not understood by the Node.js API.

ERR_INVALID_ADDRESS_FAMILY

The provided address family is not understood by the Node.js API.

ERR_INVALID_ARG_TYPE

An argument of the wrong type was passed to a Node.js API.

ERR_INVALID_ARG_VALUE

An invalid or unsupported value was passed for a given argument.

ERR_INVALID_ASYNC_ID

An invalid `asyncId` or `triggerAsyncId` was passed using `AsyncHooks`. An id less than -1 should never happen.

ERR_INVALID_BUFFER_SIZE

A swap was performed on a `Buffer` but its size was not compatible with the operation.

ERR_INVALID_CHAR

Invalid characters were detected in headers.

ERR_INVALID_CURSOR_POS

A cursor on a given stream cannot be moved to a specified row without a specified column.

ERR_INVALID_FD

A file descriptor ('fd') was not valid (e.g. it was a negative value).

ERR_INVALID_FD_TYPE

A file descriptor ('fd') type was not valid.

ERR_INVALID_FILE_URL_HOST

A Node.js API that consumes `file:` URLs (such as certain functions in the [fs](#) module) encountered a file URL with an incompatible host. This situation can only occur on Unix-like systems where only `localhost` or an empty host is supported.

ERR_INVALID_FILE_URL_PATH

A Node.js API that consumes `file:` URLs (such as certain functions in the [fs](#) module) encountered a file URL with an incompatible path. The exact semantics for determining whether a path can be used is platform-dependent.

ERR_INVALID_HANDLE_TYPE

An attempt was made to send an unsupported "handle" over an IPC communication channel to a child process. See [subprocess.send\(\)](#) and [process.send\(\)](#) for more information.

ERR_INVALID_HTTP_TOKEN

An invalid HTTP token was supplied.

ERR_INVALID_IP_ADDRESS

An IP address is not valid.

ERR_INVALID_MIME_SYNTAX

The syntax of a MIME is not valid.

ERR_INVALID_MODULE

An attempt was made to load a module that does not exist or was otherwise not valid.

ERR_INVALID_MODULE_SPECIFIER

The imported module string is an invalid URL, package name, or package subpath specifier.

ERR_INVALID_OBJECT_DEFINE_PROPERTY

An error occurred while setting an invalid attribute on the property of an object.

ERR_INVALID_PACKAGE_CONFIG

An invalid `package.json` file failed parsing.

ERR_INVALID_PACKAGE_TARGET

The `package.json` `"exports"` field contains an invalid target mapping value for the attempted module resolution.

ERR_INVALID_PERFORMANCE_MARK

While using the Performance Timing API (`perf_hooks`), a performance mark is invalid.

ERR_INVALID_PROTOCOL

An invalid `options.protocol` was passed to `http.request()`.

ERR_INVALID_REPL_EVAL_CONFIG

Both `breakEvalOnSigint` and `eval` options were set in the `REPL` config, which is not supported.

ERR_INVALID_REPL_INPUT

The input may not be used in the `REPL`. The conditions under which this error is used are described in the `REPL` documentation.

ERR_INVALID_RETURN_PROPERTY

Thrown in case a function option does not provide a valid value for one of its returned object properties on execution.

ERR_INVALID_RETURN_PROPERTY_VALUE

Thrown in case a function option does not provide an expected value type for one of its returned object properties on execution.

ERR_INVALID_RETURN_VALUE

Thrown in case a function option does not return an expected value type on execution, such as when a function is expected to return a promise.

ERR_INVALID_STATE

Indicates that an operation cannot be completed due to an invalid state. For instance, an object may have already been destroyed, or may be performing another operation.

ERR_INVALID_SYNC_FORK_INPUT

A `Buffer`, `TypedArray`, `DataView`, or `string` was provided as `stdio` input to an asynchronous fork. See the documentation for the `child_process` module for more information.

ERR_INVALID_THIS

A Node.js API function was called with an incompatible `this` value.

```
const urlSearchParams = new URLSearchParams('foo=bar&baz=new');

const buf = Buffer.alloc(1);
urlSearchParams.has.call(buf, 'foo');
// Throws a TypeError with code 'ERR_INVALID_THIS'
```

COPY

ERR_INVALID_TRANSFER_OBJECT

An invalid transfer object was passed to `postMessage()`.

ERR_INVALID_TUPLE

An element in the `iterable` provided to the [WHATWG URLSearchParams constructor](#) did not represent a `[name, value]` tuple – that is, if an element is not iterable, or does not consist of exactly two elements.

ERR_INVALID_URI

An invalid URI was passed.

ERR_INVALID_URL

An invalid URL was passed to the [WHATWG URL constructor](#) or the legacy [url.parse\(\)](#) to be parsed. The thrown error object typically has an additional property `'input'` that contains the URL that failed to parse.

ERR_INVALID_URL_SCHEME

An attempt was made to use a URL of an incompatible scheme (protocol) for a specific purpose. It is only used in the [WHATWG URL API](#) support in the [fs](#) module (which only accepts URLs with `'file'` scheme), but may be used in other Node.js APIs as well in the future.

ERR_IPC_CHANNEL_CLOSED

An attempt was made to use an IPC communication channel that was already closed.

ERR_IPC_DISCONNECTED

An attempt was made to disconnect an IPC communication channel that was already disconnected. See the documentation for the [child_process](#) module for more information.

ERR_IPC_ONE_PIPE

An attempt was made to create a child Node.js process using more than one IPC communication channel. See the documentation for the [child_process](#) module for more information.

ERR_IPC_SYNC_FORK

An attempt was made to open an IPC communication channel with a synchronously forked Node.js process. See the documentation for the [child_process](#) module for more information.

ERR_LOADER_CHAIN_INCOMPLETE

An ESM loader hook returned without calling `next()` and without explicitly signaling a short circuit.

ERR_MANIFEST_ASSERT_INTEGRITY

An attempt was made to load a resource, but the resource did not match the integrity defined by the policy manifest. See the documentation for [policy](#) manifests for more information.

ERR_MANIFEST_DEPENDENCY_MISSING

An attempt was made to load a resource, but the resource was not listed as a dependency from the location that attempted to load it. See the documentation for [policy](#) manifests for more information.

ERR_MANIFEST_INTEGRITY_MISMATCH

An attempt was made to load a policy manifest, but the manifest had multiple entries for a resource which did not match each other. Update the manifest entries to match in order to resolve this error. See the documentation for [policy](#) manifests for more information.

ERR_MANIFEST_INVALID_RESOURCE_FIELD

A policy manifest resource had an invalid value for one of its fields. Update the manifest entry to match in order to resolve this error. See the documentation for [policy](#) manifests for more information.

ERR_MANIFEST_INVALID_SPECIFIER

A policy manifest resource had an invalid value for one of its dependency mappings. Update the manifest entry to match to resolve this error. See the documentation for [policy](#) manifests for more information.

ERR_MANIFEST_PARSE_POLICY

An attempt was made to load a policy manifest, but the manifest was unable to be parsed. See the documentation for [policy](#) manifests for more information.

ERR_MANIFEST_TDZ

An attempt was made to read from a policy manifest, but the manifest initialization has not yet taken place. This is likely a bug in Node.js.

ERR_MANIFEST_UNKNOWN_ONERROR

A policy manifest was loaded, but had an unknown value for its "onerror" behavior. See the documentation for [policy](#) manifests for more information.

ERR_MEMORY_ALLOCATION_FAILED

An attempt was made to allocate memory (usually in the C++ layer) but it failed.

ERR_MESSAGE_TARGET_CONTEXT_UNAVAILABLE

A message posted to a [MessagePort](#) could not be deserialized in the target [vm](#) Context . Not all Node.js objects can be successfully instantiated in any context at this time, and attempting to transfer them using `postMessage()` can fail on the receiving side in that case.

ERR_METHOD_NOT_IMPLEMENTED

A method is required but not implemented.

ERR_MISSING_ARGS

A required argument of a Node.js API was not passed. This is only used for strict compliance with the API specification (which in some cases may accept `func(undefined)` but not `func()`). In most native Node.js APIs, `func(undefined)` and `func()` are treated identically, and the [ERR_INVALID_ARG_TYPE](#) error code may be used instead.

ERR_MISSING_OPTION

For APIs that accept options objects, some options might be mandatory. This code is thrown if a required option is missing.

ERR_MISSING_PASSPHRASE

An attempt was made to read an encrypted key without specifying a passphrase.

ERR_MISSING_PLATFORM_FOR_WORKER

The V8 platform used by this instance of Node.js does not support creating Workers. This is caused by lack of embedder support for Workers. In particular, this error will not occur with standard builds of Node.js.

ERR_MISSING_TRANSFERABLE_IN_TRANSFER_LIST

An object that needs to be explicitly listed in the `transferList` argument is in the object passed to a `postMessage()` call, but is not provided in the `transferList` for that call. Usually, this is a `MessagePort`.

In Node.js versions prior to v15.0.0, the error code being used here was `ERR_MISSING_MESSAGE_PORT_IN_TRANSFER_LIST`. However, the set of transferable object types has been expanded to cover more types than `MessagePort`.

ERR_MODULE_NOT_FOUND

A module file could not be resolved by the ECMAScript modules loader while attempting an `import` operation or when loading the program entry point.

ERR_MULTIPLE_CALLBACK

A callback was called more than once.

A callback is almost always meant to only be called once as the query can either be fulfilled or rejected but not both at the same time. The latter would be possible by calling a callback more than once.

ERR_NAPI_CONS_FUNCTION

While using `Node-API`, a constructor passed was not a function.

ERR_NAPI_INVALID_DATAVIEW_ARGS

While calling `napi_create_dataview()`, a given `offset` was outside the bounds of the dataview or `offset + length` was larger than a length of given `buffer`.

ERR_NAPI_INVALID_TYPEDARRAY_ALIGNMENT

While calling `napi_create_typedarray()`, the provided `offset` was not a multiple of the element size.

ERR_NAPI_INVALID_TYPEDARRAY_LENGTH

While calling `napi_create_typedarray()`, $(length * size_of_element) + byte_offset$ was larger than the length of given `buffer`.

ERR_NAPI_TSFN_CALL_JS

An error occurred while invoking the JavaScript portion of the thread-safe function.

ERR_NAPI_TSFN_GET_UNDEFINED

An error occurred while attempting to retrieve the JavaScript `undefined` value.

ERR_NAPI_TSFN_START_IDLE_LOOP

On the main thread, values are removed from the queue associated with the thread-safe function in an idle loop. This error indicates that an error has occurred when attempting to start the loop.

ERR_NAPI_TSFN_STOP_IDLE_LOOP

Once no more items are left in the queue, the idle loop must be suspended. This error indicates that the idle loop has failed to stop.

ERR_NOT_BUILDING_SNAPSHOT

An attempt was made to use operations that can only be used when building V8 startup snapshot even though Node.js isn't building one.

ERR_NOT_IN_SINGLE_EXECUTABLE_APPLICATION

The operation cannot be performed when it's not in a single-executable application.

ERR_NOT_SUPPORTED_IN_SNAPSHOT

An attempt was made to perform operations that are not supported when building a startup snapshot.

ERR_NO_CRYPTO

An attempt was made to use crypto features while Node.js was not compiled with OpenSSL crypto support.

ERR_NO_ICU

An attempt was made to use features that require [ICU](#) , but Node.js was not compiled with ICU support.

ERR_NON_CONTEXT_AWARE_DISABLED

A non-context-aware native addon was loaded in a process that disallows them.

ERR_OUT_OF_RANGE

A given value is out of the accepted range.

ERR_PACKAGE_IMPORT_NOT_DEFINED

The `package.json` ["imports"](#) field does not define the given internal package specifier mapping.

ERR_PACKAGE_PATH_NOT_EXPORTED

The `package.json` ["exports"](#) field does not export the requested subpath. Because exports are encapsulated, private internal modules that are not exported cannot be imported through the package resolution, unless using an absolute URL.

ERR_PARSE_ARGS_INVALID_OPTION_VALUE

When `strict` set to `true` , thrown by [util.parseArgs\(\)](#) if a [<boolean>](#) value is provided for an option of type [<string>](#) , or if a [<string>](#) value is provided for an option of type [<boolean>](#) .

ERR_PARSE_ARGS_UNEXPECTED_POSITIONAL

Thrown by [util.parseArgs\(\)](#) , when a positional argument is provided and `allowPositionals` is set to `false` .

ERR_PARSE_ARGS_UNKNOWN_OPTION

When `strict` set to `true` , thrown by [util.parseArgs\(\)](#) if an argument is not configured in `options` .

ERR_PERFORMANCE_INVALID_TIMESTAMP

An invalid timestamp value was provided for a performance mark or measure.

ERR_PERFORMANCE_MEASURE_INVALID_OPTIONS

Invalid options were provided for a performance measure.

ERR_PROTO_ACCESS

Accessing `Object.prototype.__proto__` has been forbidden using `--disable-prototype-throw`. `Object.getPrototypeOf` and `Object.setPrototypeOf` should be used to get and set the prototype of an object.

ERR_REQUIRE_CYCLE_MODULE

Stability: 1 - Experimental

When trying to `require()` a [ES Module](#) under `--experimental-require-module`, a CommonJS to ESM or ESM to CommonJS edge participates in an immediate cycle. This is not allowed because ES Modules cannot be evaluated while they are already being evaluated.

To avoid the cycle, the `require()` call involved in a cycle should not happen at the top-level of either an ES Module (via `createRequire()`) or a CommonJS module, and should be done lazily in an inner function.

ERR_REQUIRE_ASYNC_MODULE

Stability: 1 - Experimental

When trying to `require()` a [ES Module](#) under `--experimental-require-module`, the module turns out to be asynchronous. That is, it contains top-level `await`.

To see where the top-level `await` is, use `--experimental-print-required-tla` (this would execute the modules before looking for the top-level `awaits`).

ERR_REQUIRE_ESM

Stability: 1 - Experimental

An attempt was made to `require()` an [ES Module](#).

To enable `require()` for synchronous module graphs (without top-level `await`), use `--experimental-require-module`.

ERR_SCRIPT_EXECUTION_INTERRUPTED

Script execution was interrupted by `SIGINT` (For example, `ctrl + c` was pressed.)

ERR_SCRIPT_EXECUTION_TIMEOUT

Script execution timed out, possibly due to bugs in the script being executed.

ERR_SERVER_ALREADY_LISTEN

The [`server.listen\(\)`](#) method was called while a `net.Server` was already listening. This applies to all instances of `net.Server`, including HTTP, HTTPS, and HTTP/2 `Server` instances.

ERR_SERVER_NOT_RUNNING

The [`server.close\(\)`](#) method was called when a `net.Server` was not running. This applies to all instances of `net.Server`, including HTTP, HTTPS, and HTTP/2 `Server` instances.

ERR_SINGLE_EXECUTABLE_APPLICATION_ASSET_NOT_FOUND

A key was passed to single executable application APIs to identify an asset, but no match could be found.

ERR_SOCKET_ALREADY_BOUND

An attempt was made to bind a socket that has already been bound.

ERR_SOCKET_BAD_BUFFER_SIZE

An invalid (negative) size was passed for either the `recvBufferSize` or `sendBufferSize` options in [`dgram.createSocket\(\)`](#).

ERR_SOCKET_BAD_PORT

An API function expecting a port ≥ 0 and < 65536 received an invalid value.

ERR_SOCKET_BAD_TYPE

An API function expecting a socket type (`udp4` or `udp6`) received an invalid value.

ERR_SOCKET_BUFFER_SIZE

While using [`dgram.createSocket\(\)`](#), the size of the receive or send `Buffer` could not be determined.

ERR_SOCKET_CLOSED

An attempt was made to operate on an already closed socket.

ERR_SOCKET_CLOSED_BEFORE_CONNECTION

When calling [`net.Socket.write\(\)`](#) on a connecting socket and the socket was closed before the connection was established.

ERR_SOCKET_CONNECTION_TIMEOUT

The socket was unable to connect to any address returned by the DNS within the allowed timeout when using the family autoselection algorithm.

ERR_SOCKET_DGRAM_IS_CONNECTED

A [`dgram.connect\(\)`](#) call was made on an already connected socket.

ERR_SOCKET_DGRAM_NOT_CONNECTED

A [`dgram.disconnect\(\)`](#) or [`dgram.remoteAddress\(\)`](#) call was made on a disconnected socket.

ERR_SOCKET_DGRAM_NOT_RUNNING

A call was made and the UDP subsystem was not running.

ERR_SRI_PARSE

A string was provided for a Subresource Integrity check, but was unable to be parsed. Check the format of integrity attributes by looking at the [Subresource Integrity specification](#).

ERR_STREAM_ALREADY_FINISHED

A stream method was called that cannot complete because the stream was finished.

ERR_STREAM_CANNOT_PIPE

An attempt was made to call `stream.pipe()` on a [Writable](#) stream.

ERR_STREAM_DESTROYED

A stream method was called that cannot complete because the stream was destroyed using `stream.destroy()`.

ERR_STREAM_NULL_VALUES

An attempt was made to call `stream.write()` with a `null` chunk.

ERR_STREAM_PREMATURE_CLOSE

An error returned by `stream.finished()` and `stream.pipeline()`, when a stream or a pipeline ends non gracefully with no explicit error.

ERR_STREAM_PUSH_AFTER_EOF

An attempt was made to call `stream.push()` after a `null` (EOF) had been pushed to the stream.

ERR_STREAM_UNSHIFT_AFTER_END_EVENT

An attempt was made to call `stream.unshift()` after the `'end'` event was emitted.

ERR_STREAM_WRAP

Prevents an abort if a string decoder was set on the Socket or if the decoder is in `objectMode`.

```
const Socket = require('node:net').Socket;
const instance = new Socket();
```

```
instance.setEncoding('utf8');
```

COPY

ERR_STREAM_WRITE_AFTER_END

An attempt was made to call `stream.write()` after `stream.end()` has been called.

ERR_STRING_TOO_LONG

An attempt has been made to create a string longer than the maximum allowed length.

ERR_SYNTHETIC

An artificial error object used to capture the call stack for diagnostic reports.

ERR_SYSTEM_ERROR

An unspecified or non-specific system error has occurred within the Node.js process. The error object will have an `err.info` object property with additional details.

ERR_TAP_LEXER_ERROR

An error representing a failing lexer state.

ERR_TAP_PARSER_ERROR

An error representing a failing parser state. Additional information about the token causing the error is available via the `cause` property.

ERR_TAP_VALIDATION_ERROR

This error represents a failed TAP validation.

ERR_TEST_FAILURE

This error represents a failed test. Additional information about the failure is available via the `cause` property. The `failureType` property specifies what the test was doing when the failure occurred.

ERR_TLS_ALPN_CALLBACK_INVALID_RESULT

This error is thrown when an `ALPNCallback` returns a value that is not in the list of ALPN protocols offered by the client.

ERR_TLS_ALPN_CALLBACK_WITH_PROTOCOLS

This error is thrown when creating a `TLS` server if the TLS options include both `ALPNProtocols` and `ALPNCallback`. These options are mutually exclusive.

ERR_TLS_CERT_ALTNAME_FORMAT

This error is thrown by `checkServerIdentity` if a user-supplied `subjectAltname` property violates encoding rules. Certificate objects produced by Node.js itself always comply with encoding rules and will never cause this error.

ERR_TLS_CERT_ALTNAME_INVALID

While using TLS, the host name/IP of the peer did not match any of the `subjectAltNames` in its certificate.

ERR_TLS_DH_PARAM_SIZE

While using TLS, the parameter offered for the Diffie-Hellman (`DH`) key-agreement protocol is too small. By default, the key length must be greater than or equal to 1024 bits to avoid vulnerabilities, even though it is strongly recommended to use 2048 bits or larger for stronger security.

ERR_TLS_HANDSHAKE_TIMEOUT

A TLS/SSL handshake timed out. In this case, the server must also abort the connection.

ERR_TLS_INVALID_CONTEXT

The context must be a `SecureContext`.

ERR_TLS_INVALID_PROTOCOL_METHOD

The specified `secureProtocol` method is invalid. It is either unknown, or disabled because it is insecure.

ERR_TLS_INVALID_PROTOCOL_VERSION

Valid TLS protocol versions are `'TLSv1'`, `'TLSv1.1'`, or `'TLSv1.2'`.

ERR_TLS_INVALID_STATE

The TLS socket must be connected and securely established. Ensure the `'secure'` event is emitted before continuing.

ERR_TLS_PROTOCOL_VERSION_CONFLICT

Attempting to set a TLS protocol `minVersion` or `maxVersion` conflicts with an attempt to set the `secureProtocol` explicitly. Use one mechanism or the other.

ERR_TLS_PSK_SET_IDENTITY_HINT_FAILED

Failed to set PSK identity hint. Hint may be too long.

ERR_TLS_RENEGOTIATION_DISABLED

An attempt was made to renegotiate TLS on a socket instance with renegotiation disabled.

ERR_TLS_REQUIRED_SERVER_NAME

While using TLS, the `server.addContext()` method was called without providing a host name in the first parameter.

ERR_TLS_SESSION_ATTACK

An excessive amount of TLS renegotiations is detected, which is a potential vector for denial-of-service attacks.

ERR_TLS_SNI_FROM_SERVER

An attempt was made to issue Server Name Indication from a TLS server-side socket, which is only valid from a client.

ERR_TRACE_EVENTS_CATEGORY_REQUIRED

The `trace_events.createTracing()` method requires at least one trace event category.

ERR_TRACE_EVENTS_UNAVAILABLE

The `node:trace_events` module could not be loaded because Node.js was compiled with the `--without-v8-platform` flag.

ERR_TRANSFORM_ALREADY_TRANSFORMING

A `Transform` stream finished while it was still transforming.

ERR_TRANSFORM_WITH_LENGTH_0

A `Transform` stream finished with data still in the write buffer.

ERR_TTY_INIT_FAILED

The initialization of a TTY failed due to a system error.

ERR_UNAVAILABLE_DURING_EXIT

Function was called within a `process.on('exit')` handler that shouldn't be called within `process.on('exit')` handler.

ERR_UNCAUGHT_EXCEPTION_CAPTURE_ALREADY_SET

[process.setUncaughtExceptionCaptureCallback\(\)](#) was called twice, without first resetting the callback to `null`.

This error is designed to prevent accidentally overwriting a callback registered from another module.

ERR_UNESCAPED_CHARACTERS

A string that contained unescaped characters was received.

ERR_UNHANDLED_ERROR

An unhandled error occurred (for instance, when an `'error'` event is emitted by an [EventEmitter](#) but an `'error'` handler is not registered).

ERR_UNKNOWN_BUILTIN_MODULE

Used to identify a specific kind of internal Node.js error that should not typically be triggered by user code. Instances of this error point to an internal bug within the Node.js binary itself.

ERR_UNKNOWN_CREDENTIAL

A Unix group or user identifier that does not exist was passed.

ERR_UNKNOWN_ENCODING

An invalid or unknown encoding option was passed to an API.

ERR_UNKNOWN_FILE_EXTENSION

Stability: 1 - Experimental

An attempt was made to load a module with an unknown or unsupported file extension.

ERR_UNKNOWN_MODULE_FORMAT

Stability: 1 - Experimental

An attempt was made to load a module with an unknown or unsupported format.

ERR_UNKNOWN_SIGNAL

An invalid or unknown process signal was passed to an API expecting a valid signal (such as [subprocess.kill\(\)](#)).

ERR_UNSUPPORTED_DIR_IMPORT

`import` a directory URL is unsupported. Instead, [self-reference a package using its name](#) and [define a custom subpath](#) in the `"exports"` field of the [package.json](#) file.

```
import './'; // unsupported
import './index.js'; // supported
import 'package-name'; // supported
```

COPY

ERR_UNSUPPORTED_ESM_URL_SCHEME

`import` with URL schemes other than `file` and `data` is unsupported.

ERR_UNSUPPORTED_RESOLVE_REQUEST

An attempt was made to resolve an invalid module referrer. This can happen when importing or calling `import.meta.resolve()` with either:

- a bare specifier that is not a builtin module from a module whose URL scheme is not `file` .
- a [relative URL](#) from a module whose URL scheme is not a [special scheme](#) .

```
try {  
  // Trying to import the package 'bare-specifier' from a `data:` URL module:  
  await import('data:text/javascript,import "bare-specifier"');  
} catch (e) {  
  console.log(e.code); // ERR_UNSUPPORTED_RESOLVE_REQUEST  
}
```

COPY

ERR_USE_AFTER_CLOSE

Stability: 1 - Experimental

An attempt was made to use something that was already closed.

ERR_VALID_PERFORMANCE_ENTRY_TYPE

While using the Performance Timing API (`perf_hooks`), no valid performance entry types are found.

ERR_VM_DYNAMIC_IMPORT_CALLBACK_MISSING_FLAG

A dynamic import callback was invoked without `--experimental-vm-modules` .

ERR_VM_DYNAMIC_IMPORT_CALLBACK_MISSING

A dynamic import callback was not specified.

ERR_VM_MODULE_ALREADY_LINKED

The module attempted to be linked is not eligible for linking, because of one of the following reasons:

- It has already been linked (`linkingStatus` is `'linked'`)
- It is being linked (`linkingStatus` is `'linking'`)
- Linking has failed for this module (`linkingStatus` is `'errored'`)

ERR_VM_MODULE_CACHED_DATA_REJECTED

The `cachedData` option passed to a module constructor is invalid.

ERR_VM_MODULE_CANNOT_CREATE_CACHED_DATA

Cached data cannot be created for modules which have already been evaluated.

ERR_VM_MODULE_DIFFERENT_CONTEXT

The module being returned from the linker function is from a different context than the parent module. Linked modules must share the same context.

ERR_VM_MODULE_LINK_FAILURE

The module was unable to be linked due to a failure.

ERR_VM_MODULE_NOT_MODULE

The fulfilled value of a linking promise is not a `vm.Module` object.

ERR_VM_MODULE_STATUS

The current module's status does not allow for this operation. The specific meaning of the error depends on the specific function.

ERR_WASI_ALREADY_STARTED

The WASI instance has already started.

ERR_WASI_NOT_STARTED

The WASI instance has not been started.

ERR_WEBASSEMBLY_RESPONSE

The `Response` that has been passed to `WebAssembly.compileStreaming` or to `WebAssembly.instantiateStreaming` is not a valid WebAssembly response.

ERR_WORKER_INIT_FAILED

The `Worker` initialization failed.

ERR_WORKER_INVALID_EXEC_ARGV

The `execArgv` option passed to the `Worker` constructor contains invalid flags.

ERR_WORKER_NOT_RUNNING

An operation failed because the `Worker` instance is not currently running.

ERR_WORKER_OUT_OF_MEMORY

The `Worker` instance terminated because it reached its memory limit.

ERR_WORKER_PATH

The path for the main script of a worker is neither an absolute path nor a relative path starting with `./` or `../`.

ERR_WORKER_UNSERIALIZABLE_ERROR

All attempts at serializing an uncaught exception from a worker thread failed.

ERR_WORKER_UNSUPPORTED_OPERATION

The requested functionality is not supported in worker threads.

ERR_ZLIB_INITIALIZATION_FAILED

Creation of a [zlib](#) object failed due to incorrect configuration.

HPE_HEADER_OVERFLOW

Too much HTTP header data was received. In order to protect against malicious or malconfigured clients, if more than `maxHeaderSize` of HTTP header data is received then HTTP parsing will abort without a request or response object being created, and an `Error` with this code will be emitted.

HPE_CHUNK_EXTENSIONS_OVERFLOW

Too much data was received for a chunk extensions. In order to protect against malicious or malconfigured clients, if more than 16 KiB of data is received then an `Error` with this code will be emitted.

HPE_UNEXPECTED_CONTENT_LENGTH

Server is sending both a `Content-Length` header and `Transfer-Encoding: chunked`.

`Transfer-Encoding: chunked` allows the server to maintain an HTTP persistent connection for dynamically generated content. In this case, the `Content-Length` HTTP header cannot be used.

Use `Content-Length` or `Transfer-Encoding: chunked`.

MODULE_NOT_FOUND

A module file could not be resolved by the CommonJS modules loader while attempting a [require\(\)](#) operation or when loading the program entry point.

Legacy Node.js error codes

Stability: 0 - Deprecated. These error codes are either inconsistent, or have been removed.

ERR_CANNOT_TRANSFER_OBJECT

The value passed to `postMessage()` contained an object that is not supported for transferring.

ERR_CRYPTO_HASH_DIGEST_NO_UTF16

The UTF-16 encoding was used with [hash.digest\(\)](#). While the `hash.digest()` method does allow an `encoding` argument to be passed in, causing the method to return a string rather than a `Buffer`, the UTF-16 encoding (e.g. `ucs` or `utf16le`) is not supported.

ERR_HTTP2_FRAME_ERROR

Used when a failure occurs sending an individual frame on the HTTP/2 session.

ERR_HTTP2_HEADERS_OBJECT

Used when an HTTP/2 Headers Object is expected.

ERR_HTTP2_HEADER_REQUIRED

Used when a required header is missing in an HTTP/2 message.

ERR_HTTP2_INFO_HEADERS_AFTER_RESPOND

HTTP/2 informational headers must only be sent *prior* to calling the `Http2Stream.prototype.respond()` method.

ERR_HTTP2_STREAM_CLOSED

Used when an action has been performed on an HTTP/2 Stream that has already been closed.

ERR_HTTP_INVALID_CHAR

Used when an invalid character is found in an HTTP response status message (reason phrase).

ERR_INDEX_OUT_OF_RANGE

A given index was out of the accepted range (e.g. negative offsets).

ERR_INVALID_OPT_VALUE

An invalid or unexpected value was passed in an options object.

ERR_INVALID_OPT_VALUE_ENCODING

An invalid or unknown file encoding was passed.

ERR_MISSING_MESSAGE_PORT_IN_TRANSFER_LIST

This error code was replaced by [ERR_MISSING_TRANSFERABLE_IN_TRANSFER_LIST](#) in Node.js v15.0.0, because it is no longer accurate as other types of transferable objects also exist now.

ERR_NAPI_CONS_PROTOTYPE_OBJECT

Used by the `Node-API` when `Constructor.prototype` is not an object.

ERR_NETWORK_IMPORT_BAD_RESPONSE

Stability: 1 - Experimental

Response was received but was invalid when importing a module over the network.

ERR_NETWORK_IMPORT_DISALLOWED

Stability: 1 - Experimental

A network module attempted to load another module that it is not allowed to load. Likely this restriction is for security reasons.

ERR_NO_LONGER_SUPPORTED

A Node.js API was called in an unsupported manner, such as `Buffer.write(string, encoding, offset[, length])`.

ERR_OPERATION_FAILED

An operation failed. This is typically used to signal the general failure of an asynchronous operation.

ERR_OUTOFMEMORY

Used generically to identify that an operation caused an out of memory condition.

ERR_PARSE_HISTORY_DATA

The `node:repl` module was unable to parse data from the REPL history file.

ERR_SOCKET_CANNOT_SEND

Data could not be sent on a socket.

ERR_STDERR_CLOSE

An attempt was made to close the `process.stderr` stream. By design, Node.js does not allow `stdout` or `stderr` streams to be closed by user code.

ERR_STDOUT_CLOSE

An attempt was made to close the `process.stdout` stream. By design, Node.js does not allow `stdout` or `stderr` streams to be closed by user code.

ERR_STREAM_READ_NOT_IMPLEMENTED

Used when an attempt is made to use a readable stream that has not implemented [readable.read\(\)](#).

ERR_TLS_RENEGOTIATION_FAILED

Used when a TLS renegotiation request has failed in a non-specific way.

ERR_TRANSFERRING_EXTERNALIZED_SHAREDARRAYBUFFER

A `SharedArrayBuffer` whose memory is not managed by the JavaScript engine or by Node.js was encountered during serialization. Such a `SharedArrayBuffer` cannot be serialized.

This can only happen when native addons create `SharedArrayBuffer`s in "externalized" mode, or put existing `SharedArrayBuffer` into externalized mode.

ERR_UNKNOWN_STDIN_TYPE

An attempt was made to launch a Node.js process with an unknown `stdin` file type. This error is usually an indication of a bug within Node.js itself, although it is possible for user code to trigger it.

ERR_UNKNOWN_STREAM_TYPE

An attempt was made to launch a Node.js process with an unknown `stdout` or `stderr` file type. This error is usually an indication of a bug within Node.js itself, although it is possible for user code to trigger it.

ERR_V8BREAKITERATOR

The V8 `BreakIterator` API was used but the full ICU data set is not installed.

ERR_VALUE_OUT_OF_RANGE

Used when a given value is out of the accepted range.

ERR_VM_MODULE_NOT_LINKED

The module must be successfully linked before instantiation.

ERR_VM_MODULE_LINKING_ERRORED

The linker function returned a module for which linking has failed.

ERR_WORKER_UNSUPPORTED_EXTENSION

The pathname used for the main script of a worker has an unknown file extension.

ERR_ZLIB_BINDING_CLOSED

Used when an attempt is made to use a `zlib` object after it has already been closed.

ERR_CPU_USAGE

The native call from `process.cpuUsage` could not be processed.

OpenSSL Error Codes

Time Validity Errors

CERT_NOT_YET_VALID

The certificate is not yet valid: the `notBefore` date is after the current time.

CERT_HAS_EXPIRED

The certificate has expired: the `notAfter` date is before the current time.

CRL_NOT_YET_VALID

The certificate revocation list (CRL) has a future issue date.

CRL_HAS_EXPIRED

The certificate revocation list (CRL) has expired.

CERT_REVOKED

The certificate has been revoked; it is on a certificate revocation list (CRL).

Trust or Chain Related Errors

UNABLE_TO_GET_ISSUER_CERT

The issuer certificate of a looked up certificate could not be found. This normally means the list of trusted certificates is not complete.

UNABLE_TO_GET_ISSUER_CERT_LOCALLY

The certificate's issuer is not known. This is the case if the issuer is not included in the trusted certificate list.

DEPTH_ZERO_SELF_SIGNED_CERT

The passed certificate is self-signed and the same certificate cannot be found in the list of trusted certificates.

SELF_SIGNED_CERT_IN_CHAIN

The certificate's issuer is not known. This is the case if the issuer is not included in the trusted certificate list.

CERT_CHAIN_TOO_LONG

The certificate chain length is greater than the maximum depth.

UNABLE_TO_GET_CRL

The CRL reference by the certificate could not be found.

UNABLE_TO_VERIFY_LEAF_SIGNATURE

No signatures could be verified because the chain contains only one certificate and it is not self signed.

CERT_UNTRUSTED

The root certificate authority (CA) is not marked as trusted for the specified purpose.

Basic Extension Errors

INVALID_CA

A CA certificate is invalid. Either it is not a CA or its extensions are not consistent with the supplied purpose.

PATH_LENGTH_EXCEEDED

The basicConstraints pathlength parameter has been exceeded.

Name Related Errors

HOSTNAME_MISMATCH

Certificate does not match provided name.

Usage and Policy Errors

INVALID_PURPOSE

The supplied certificate cannot be used for the specified purpose.

CERT_REJECTED

The root CA is marked to reject the specified purpose.

Formatting Errors

CERT_SIGNATURE_FAILURE

The signature of the certificate is invalid.

CRL_SIGNATURE_FAILURE

The signature of the certificate revocation list (CRL) is invalid.

ERROR_IN_CERT_NOT_BEFORE_FIELD

The certificate notBefore field contains an invalid time.

ERROR_IN_CERT_NOT_AFTER_FIELD

The certificate notAfter field contains an invalid time.

ERROR_IN_CRL_LAST_UPDATE_FIELD

The CRL lastUpdate field contains an invalid time.

ERROR_IN_CRL_NEXT_UPDATE_FIELD

The CRL nextUpdate field contains an invalid time.

UNABLE_TO_DECRYPT_CERT_SIGNATURE

The certificate signature could not be decrypted. This means that the actual signature value could not be determined rather than it not matching the expected value, this is only meaningful for RSA keys.

UNABLE_TO_DECRYPT_CRL_SIGNATURE

The certificate revocation list (CRL) signature could not be decrypted: this means that the actual signature value could not be determined rather than it not matching the expected value.

UNABLE_TO_DECODE_ISSUER_PUBLIC_KEY

The public key in the certificate SubjectPublicKeyInfo could not be read.

Other OpenSSL Errors

OUT_OF_MEM

An error occurred trying to allocate memory. This should never happen.
